Chronic diseases—such as cancer, heart disease, stroke, arthritis, asthma and diabetes—are among the most prevalent, costly, and preventable of all health problems. This annual Brief Report provides a snapshot of the burden of chronic disease in Alaska. For more information on chronic disease burden and steps being taken by the Section of Chronic Disease Prevention and Health Promotion to impact chronic disease, visit: http://dhss.alaska.gov/dph/Chronic/Pages/default.aspx. Alignment with the Alaska Division of Public Health’s Strategic Plan is noted with the HA-2020 icon. Alignment with Healthy Alaskans 2020 is noted with the HA-2020 icon.

**CHRONIC DISEASE MORBIDITY AND MORTALITY**

**CANCER**
Cancer is the leading cause of death in Alaska.
- 24% of all deaths in Alaska in 2014 were due to cancer. (Alaska Bureau of Vital Statistics [ABVS])
- The most commonly diagnosed cancers in Alaska are: (1) breast, (2) lung, (3) prostate, and (4) colorectal. These 4 cancers account for 51% of all cancer cases. (AK Cancer Registry [ACR], 2008-12)

**HEART DISEASE AND STROKE**
- Heart disease and stroke are the 2nd and 4th leading causes of death in Alaska. (ABVS, 2014)
- In 2014 in Alaska, heart disease accounted for 19% of deaths; stroke accounted for 4%. (ABVS)
- In 2014, 26% of adults in Alaska reported having high blood pressure. In 2013, 38% of those tested reported having high blood cholesterol. (Behavioral Surveillance Risk Factor System [BRFSS])

**DIABETES**
In 2014, diabetes was the 7th leading cause of death in Alaska. (ABVS) Likely to be underreported as a cause of death, the risk of death among people with diabetes is about twice that of people without diabetes of similar age.
- 113 Alaskans died from diabetes in 2014. (ABVS)
- In 2014, 8% of adults in Alaska reported being diagnosed with non-pregnancy related diabetes. (BRFSS)

**ARTHRITIS**
- Arthritis is the most common cause of disability in the US, affecting more than 52 million Americans. (National Health Interview Survey, 2010-2012)
- In 2014, 22% of adults in Alaska reported being diagnosed with arthritis. (BRFSS)

**CHRONIC DISEASE RISK FACTORS**

Four healthy lifestyle factors—never smoking, maintaining a healthy weight, exercising regularly and following a healthy diet—together appear to be associated with as much as an 80 percent reduction in the risk of developing the most common and deadly chronic diseases. Conversely, engaging in tobacco use, being inactive, having a poor diet, and being overweight or obese greatly increase the likelihood that one will develop, have reduced quality of life from, and ultimately die from a chronic disease.

**NUTRITION, PHYSICAL ACTIVITY, AND OBESITY**

For over 20 years, the prevalence of obesity has increased sharply for Alaska adults. Physical inactivity and unhealthy eating contribute to overweight and obesity and a number of chronic diseases, including some cancers, cardiovascular disease, and diabetes.

- 66% of Alaska adults (2014 BRFSS) and 31% of Alaska high school students (2015 Youth Risk Behavior Survey [YRBS]) were overweight or obese, based on self-reported height and weight.
- 46% of high school students (2015 YRBS) and 25% of adults (2013 BRFSS) in Alaska consumed one or more sugary drinks per day.

- 57% of Alaska high school students did not attend PE class in the past week. (2015 YRBS)

**TOBACCO**

Tobacco use is the leading cause of preventable disease and death in the United States. The use of tobacco products (both cigarettes and smokeless tobacco products, such as chewing tobacco) is responsible for 30% of all cancer deaths, 21% of all coronary heart disease deaths, and 18% of all stroke deaths. For every one person who dies from tobacco use, another 20 suffer reduced quality of life from tobacco-related illness.

- 20% of adults (2014 BRFSS) and 11% of high school students (2015 YRBS) in Alaska currently smoke.

1 except 2013 where noted with an ^
Access to health services includes gaining entry into the health care system, accessing a health care location where needed services are provided, and finding a health care provider with whom the patient can communicate and trust. Access to health care impacts everything from prevention of disease and disability, quality of life, and life expectancy. Among the health care services one can access are clinical preventive services, such as routine disease screening and scheduled immunizations. Optimal provision of these services can both prevent and detect illnesses and diseases in their earlier, more treatable stages, significantly reducing the risk of illness, disability, and early death.

No health care coverage
Uninsured adults are less likely than insured adults to receive preventive services or screenings, such as mammograms, pap smears, or prostate screening. In turn, inadequate prevention and screening increase the likelihood of preventable illness, missed diagnoses, and delays in treatment.

- In 2014, 18% of adults aged 18-64 in Alaska reported having no health care coverage.

Early detection
Uncontrolled blood glucose increases the risks for heart disease, stroke, kidney disease, blindness and amputation.

- In 2014, 49% of Alaska adults had not had a blood glucose test in the past 3 years.

Mammography is a screening method that has been shown to reduce mortality due to breast cancer. In 2014, 32% of women in Alaska between the ages of 50 and 74 reported not having had a mammogram within the last 2 years (the current recommendation).

Colorectal cancer screening reduces mortality from colorectal cancer. Colorectal cancer can be prevented by removing precancerous polyps or abnormal growths, which can be identified during a sigmoidoscopy or colonoscopy.

- In 2014, among Alaskans aged 50 to 75 years, 37% reported never having had a sigmoidoscopy or colonoscopy.

Preventive Services, Alaska Compared with United States, BRFSS (2014)
HEALTH INEQUITY IN CHRONIC DISEASE AND RELATED RISK FACTORS

Social and economic conditions drive population health to an equal or greater degree than do individual choice, genetic make-up, and access to health care. Consequently, to prevent chronic disease and optimize the health of all Alaskans, the focus of public health must extend beyond healthy behaviors and health insurance to address health equity. Health equity is achieved when every person has the opportunity to “attain his or her full health potential.”

Chronic Disease Risk Factors, All Alaska Adults Compared with Select Populations, BRFSS (2014)

Such disparity in risk factors translates to disparities in chronic disease morbidity and mortality. For example:

- In 2014, the Alaska Native age-adjusted rates of death from diabetes, chronic lower respiratory disease, stroke, heart disease, and cancer (all sites) were each 1.4 to 2.1 times that of their White peers. (Alaska Bureau of Vital Statistics)
- Age-adjusted all-site cancer mortality rates are highest in the northern and western regions of Alaska. (NCHS accessed via NCI’s SEER*Stat, 2008-2012)
