Vaccine Safety and Vaccine Safety Communication

Otherwise known as
The Vaccine Wars

Mark H. Sawyer, MD
UCSD School of Medicine
Rady Children’s Hospital San Diego
Objectives

- List some of the events that led to the current climate of vaccine safety concern
- Describe factors that contribute to parental concerns about vaccines
- Develop talking points to address common myths about vaccine safety
- Develop answers to the question-What is wrong with an alternative vaccine schedule?
Vaccination is the top Public Health achievement of the 20th Century

MMWR 1999; 48:241
Invasive Pneumococcal Disease by Age and Year—Children <5 Years, 1998-2003*

Understanding Autism

Why More Kids & Families Are Facing the Challenge of ‘Mindblindness’

By Geoffrey Cowley

Parents Wonder: Is it Safe to Vaccinate?

Many families of autistic kids blame the MMR shot for the disorder. Experts say they shouldn’t.
The Things You Hear...

- Are vaccines safe?
- Vaccines and autism
  - MMR
  - Thimerosal
  - Other vaccine ingredients
  - Vaccines in general
- Too many vaccines overwhelm the immune system
- Diseases no longer exist—or aren’t that dangerous
- It is all a giant money-fueled conspiracy
- Individual rights vs. public health needs
How did we get here?
Real Vaccine Risks

- 1950-1980’s: Whole cell DTP vaccine
- 1976: Guillain-Barré from influenza vaccine
- 1980’s: OPV causing paralysis despite no cases of polio
- 1990’s: intussusception from rotavirus vaccine
How have we dealt with real vaccine risks?
Response to real vaccine adverse events

- Elimination of killed measles vaccine
- Transition from plasma derived Hep B vaccine to recombinant Hep B vaccine
- Transition from DTP to DTaP (Some countries suspended pertussis immunization)
- Transition from OPV to IPV
- Withdrawal of first rotavirus vaccine
## Rotashield: Final Analysis

Did H1N1 Influenza Vaccine Cause Guillain-Barré Syndrome?
H1N1 Influenza Vaccine Safety

- Closely monitored by CDC and National Vaccine Program Office
- Multiple large population databases scoured for adverse events related to H1N1 vaccine
  - Vaccine Safety Datalink
  - VA Health System and Dept. of Defense
  - PRISM Health Plan/Immunization Registry link
  - HIS
  - Emerging Infections Program
- More than 10 million post-H1N1 vaccination lives under observation
1998-99: The Vaccine Safety Concern 1-2 Punch
Ileal-lymphoid-nodular hyperplasia, non-specific colitis, and pervasive developmental disorder in children

A J Wakefield, S H Murch, A Anthony, J Linnell, D M Casson, M Malik, M Berelowitz, A P Dhillon, M A Thomson, P Harvey, A Valentine, S E Davies, J A Walker-Smith

Summary
Background We investigated a consecutive series of children with chronic enterocolitis and regressive developmental disorder.

Introduction
We saw several children who, after a period of apparent normality, lost acquired skills, including communication. They all had gastrointestinal symptoms, including abdominal pain, diarrhoea, and bloating and, in some
Notice to Readers

Thimerosal in Vaccines: A Joint Statement of the American Academy of Pediatrics and the Public Health Service

The Food and Drug Administration (FDA) Modernization Act of 1997 called for FDA to review and assess the risk of all mercury-containing food and drugs. In line with this review, U.S. vaccine manufacturers responded to a December 1998 and April 1999 FDA request to provide more detailed information about the thimerosal content of their preparations that include this compound as a preservative. Thimerosal has been used as an additive to biologics and vaccines since the 1930s because it is very effective in killing bacteria used in several vaccines and in preventing bacterial contamination, particularly in opened multidose containers. Some but not all of the vaccines recommended routinely for children in the United States contain thimerosal.

MMWR 1999; 48 (26):564-566
Wakefield
…and the rest of the story

- Findings never reproduced
- Wakefield had serious financial conflicts
- Co-authors withdraw from paper
- Paper retracted from Lancet
- Hearings held by British Health Authorities
- Wakefield sanctioned and license revoked
- The details of ”an elaborate fraud” published in the British Medical Journal
- Omnibus Vaccine Court has rejected autism claims
Thimerosal history

- Mercury content of recommended vaccines reviewed
- Recommendation to reduce mercury exposure
- Delay in hepatitis B vaccination of newborns to minimize mercury exposure
- Once MMR couldn’t be targeted as a cause of autism, thimerosal became an attractive target
Factors that have increased concern

- Distrust
  - Industry
  - Government
  - Doctors
- Uncertainty
- Rapid increase in the number of vaccines
- Rapid increase in the number of cases of autism
- Internet/Media/Celebrities
Know Your Source

"On the Internet, nobody knows you're a dog."
ARE WE POISONING OUR KIDS
IN THE NAME OF PROTECTING THEIR HEALTH?

Green our vaccines.
And administer them
with greater care.

Mercury, Aluminum, Formaldehyde, Ether, Antifreeze. Not exactly what you'd expect—or want—to find in your child's vaccinations. Vaccines that are supposed to safeguard their health yet, according to our studies, can also do harm to some children.

The statistics speak for themselves. Since 1983, the number of vaccines the CDC recommends we give to our kids has gone from 10 to 36, a whopping increase of 260%. And, with it, the prevalence of neurological disorders like autism and ADHD has grown exponentially as well.

Just a coincidence? We don’t think so. Thousands of parents believe their child’s regression into autism was triggered, if not caused, by over-immunization with toxic ingredients and live viruses found in vaccines. The Centers for Disease Control and the American Academy of Pediatrics dispute this but independent research and the first-hand accounts of parents tell a different story.

Why are we giving our children so many more vaccines so early in life?

Why do we only test vaccines individually and never consider the combination risk of vaccines administered together? Given the dramatic rise of autism to epidemic levels, isn't it time for the scientific community to seriously consider the anecdotal evidence of so many parents? We urge the CDC and AAP to help us find the answers to these questions and learn why the increase in the number and composition of so many vaccinations has led to a surge in neurodevelopmental disorders. Our children deserve no less.

GENERATION RESCUE
www.generationrescue.org

We want to thank Jim Carrey and Jerry MacCarty for their generous support of Generation Rescue and their unwavering commitment to solving the growing challenge of autism.
What has been the effect?

Falsehood flies and the truth comes limping after so that when men come to be undeceived it is too late. The jest is over and the tale has had its effect.

Thimerosal and Neuropsychological Function

- 1047 children 7-10 years of age
- Formal neuropsychological testing
- Correlated outcome with thimerosal exposure
- No evidence for a link between thimerosal exposure and neuropsychological functioning

Thompson WW, NEJM 2007;357:1281
2008 California Study

Schechter R, Arch Gen Psych 2008:65:19-24
VSD Studies
What we know about autism

- Highly heritable (more than breast cancer)
- Behavioral changes of autism often present before 1 year of age
- New screening tool developed to be used at 12 months of age
- Autism associated with an increase in the number of neurons (i.e. insult occurs in utero)
- Rates of autism may not be any different now than they were 40 years ago
How can you respond?

- Are vaccines safe?
- Do vaccines cause autism?
- Aren’t we overwhelming the immune system?
- Isn’t natural immunity better?
- Diseases no longer exist—or aren’t that dangerous?
- It is all a giant money-fueled conspiracy
- It’s my right to decide what’s best for my child
Know Your Source
Talking Points

- Majority of sites found on an Internet search of "Vaccines" are anti-vaccine sites
- NNII site provides tips on how to evaluate the credibility of Web sites [http://www.immunizationinfo.org](http://www.immunizationinfo.org)
- How to identify a credible web site
  - Scientific studies cited and are current
  - Lack of financial conflict of interest (selling a book)
  - Experience in field
  - Lack of anecdotes
Vaccines are Safe
Talking Points

- Hundreds of millions of doses of vaccine given every year in U.S. with no problem
- Billions of vaccines are given in the world every year with no problem
- Vaccine safety infrastructure is large
  - VAERS
  - VSD
  - CISA
  - FDA
  - CDC
Vaccines DO NOT Cause Autism
Talking Points

- Genetic factors related to autism-autism is more heritable than breast cancer
- Brain changes associated with autism relate to events that occur in utero (Corchesne E)
- Symptoms of autism present before many vaccines are given
- Ongoing studies specifically looking at risk of vaccines: none identified
- Autism hasn’t gone away despite thimerosal being taken out of vaccines
- Vaccine court has rejected the autism claim
Do vaccines overwhelm the Immune System?

- Your immune system responds to hundreds of things every day.
- No evidence that children get more infections right after they are immunized.
- Clinical trials test multiple vaccines.
- Increased vaccine purity.
Is natural immunity better?

- For some infections natural immunity “better” because it lasts longer
- Natural immunity is not complete
  - whooping cough, rotavirus
  - Multiple types of some disease agents (Pneumocococcus, influenza)
- Natural immunity is only better if you survive the illness without serious consequences
- Natural immunity comes at a price
  - deafness, brain damage, hospitalization, pneumonia, paralysis, permanent scars
Diseases Are Not That Bad

- Prior to the availability of pneumococcal vaccine there were 200 deaths/year from this disease
- Out of the 5 cases of Hib reported last year in Minnesota, one died
- San Diego measles outbreak-out of 12 cases, one hospitalized
- Quote your own experience….
Parents’ Choice vs. the “Greater Good”

- Not vaccinating puts your child at risk
- Not vaccinating your child also puts others at risk
- 3 innocent bystanders infected during San Diego measles outbreak
Personal beliefs about immunization are affecting people who do not share those beliefs.
You can’t hide in the herd

- Herd immunity is very important
  - Elimination of H. flu disease
  - Decrease in influenza and pneumococcal disease in elderly because of pediatric immunization
  - Drop in Hepatitis A disease in California
- But, you can’t hide in the herd, especially if your herd thinks like you do
1. Are Vaccines safe?
Yes. Millions of children and adults have been vaccinated safely. While any medication, even foods, can cause reactions, a child takes a much greater risk of getting a disease if he or she is not vaccinated. The most common vaccine side effects are mild and include swelling, tenderness, and fever. Set realistic expectations by acknowledging that vaccines cause mild, self-limited reactions, like injection site swelling and pain, in many children. A pain reliever may help, but parents should call the office if concerned. Serious reactions are very rare and can occur in about 1 or 2 people per million shots given.

Scientists and doctors are very careful about the way we test and use vaccines. We also vaccinate our own kids. That’s because we know that thousands of people participate in clinical trials to test vaccines before they can be approved by the Food and Drug Administration (FDA). Even after licensing, the Vaccine Adverse Events Reporting System (VAERS) tracks any adverse reaction that could be associated with a vaccine. Newer vaccines like HPV (Gardasil®) are tracked closely. Continued monitoring helps ensure that vaccines have a safe track record over time.

2. Why do children today need so many immunizations?
To save lives. Advances in medical science have developed vaccines to protect us against more than 15 dangerous diseases. Only a few years ago vaccines prevented just a small handful of diseases. Babies are especially vulnerable. Children under age one (still too young to get some shots like varicella) are at high risk of hospitalization or serious complications from vaccine-preventable diseases. These include seizures, brain damage, blindness, and even death. That’s why we have continued to develop new vaccines. And, that’s the reason children get more immunizations today than in the past.

3. Are diseases of the “old days” really still something to worry about?
Vaccine-preventable diseases still occur—though many young parents haven’t seen them. This is due to the success of our country’s immunization program. But unvaccinated children (and adults) are still at-risk for common illnesses like influenza, whooping cough, and chicken pox. Some parents may be surprised to learn that before the chicken pox vaccine, almost 11,000 Americans had to be hospitalized, and over 100 died, each year from...

The Sears Schedule

- Based on the premise that it is better to spread out vaccines
- Based on Dr. Sears’ opinion about what diseases are dangerous and what diseases a child is likely to encounter
- Based on the assumption that aluminum in vaccines causes a problem
- Based on the premise that as long as enough people don’t follow the schedule, herd immunity will be maintained
What’s Wrong with Alternative Vaccine Schedules?
What’s Wrong With Alternative Immunization Schedules?

- There is no scientific basis for them
- They leave children at risk for disease
- They leave our community at risk for outbreaks, including among those who are immunized
- They increase healthcare costs
Being Unimmunized Leaves You at Risk

Talking Points

- The unimmunized are at increased risk to develop disease and expose others
  - All of the measles cases in San Diego in 2008 were unimmunized
  - 3 of them were too young to be immunized and were exposed in a doctor’s office
- Unimmunized children are at increased risk for pertussis, mumps, chickenpox in schools
The Details of What’s Wrong With Alternative Vaccine Schedules

The Problem With Dr. Bob’s Alternative Vaccine Schedule
Paul A. Offit and Charlotte A. Moser
Pediatrics 2009;123:e164-e169
DOI: 10.1542/peds.2008-2189
Sears Message #1
Doctors don’t understand vaccines

Possible Responses

- Find a doctor you trust
- Doctor’s do not blindly follow anyone’s recommendations
- CDC, ACIP, and the AAP Committee on Infectious Disease have experts in public health, infectious disease, pediatrics whose job it is to gather and interpret ALL of the data
Sears Message #2
You Can’t Trust CDC, AAP, your doctor

Possible Responses

- What motive does your individual physician have to recommend vaccines if they didn’t believe in them?
- Why do you trust your doctor when they recommend drugs or surgery?
- Show me a report that people at CDC make money from pharmaceutical companies
Sears Message #3
Diseases Are Not That Bad

Possible Responses

- Prior to the availability of pneumococcal vaccine there were 200 deaths/year from this disease
- Out of the 5 cases of Hib reported this week in Minnesota, one died
- San Diego measles outbreak-out of 12 cases, one hospitalized
- Quote your own experience
Vaccine-Preventable Disease Are Dangerous
Talking Points

- 1 hospitalization out of 12 measles cases in San Diego (February 2008)
- Several deaths every year from pertussis in California
- At least 10% of people with meningococcal disease die
- Influenza kills thousands every year
**Sears Message #4**

**Hide in the Herd**

Possible Responses

- Everyone else is NOT immunized
- It depends on what herd you are in - a partially immunized herd is a dangerous herd
- 5 cases of Hib reported this week in Minnesota suggesting that herd immunity is waning
- You will be thrown out of the herd (quarantined) if an outbreak occurs
Sears Message #5
Natural Infection is Better

Possible Responses

- Natural immunity comes at a cost-death, deafness, mental retardation, paralysis, chronic hepatitis
- Natural immunity doesn’t work for many diseases because there are so many types
- You are taking a chance with letting your child develop natural immunity
Why Should I Put My Child At Risk For The Greater Good? Talking Points

- Because you are actually putting your child at risk by not having them immunized.
  - Measles exemptors: 35x increased risk
  - Pertussis exemptors: 5.9x increased risk
- When you or your child are not immunized, they put others at risk: measles in San Diego
- None of us want to see a resurgence of the diseases we have largely eliminated
Alternative Vaccine Schedules:
Helping Parents Separate Fact From Fear

A Guide for Physicians

Parents want to keep their children safe and healthy. Questions about the recommended immunization schedule create an opportunity for you to listen and respond to requests for “alternative schedules,” including the Dr. Bob Sears’ schedule. Help empower parents to make an informed decision about vaccinating their kids. We offer these tips to assist practitioners to respond effectively and compassionately and to build trusting relationships with patients and parents.

CONCERN: CDC schedules seem generic; alternative schedules cater to individual needs
The immunization schedule exists to protect children at the age they are most vulnerable to each disease. Children are vaccinated as soon as they are developmentally able to create an effective immune response.

EXPLAIN: Alternative schedules are not custom-made. That’s actually what doctors do. Doctors consider a patient’s medical history and give the best advice for each child. Some medically-sensitive kids are also at high risk for diseases, making shots especially important.

ASK: Do you have specific concerns about your child’s health? Let’s talk about it.

CONCERN: “Too many” vaccines, “too soon” could be harmful
Are there more vaccines now than 20 years ago? Yes—and that’s a good thing. Newer vaccines save children from terrible diseases like Hib and Meningococcal disease. This devastating infection can cause organ failure, limb amputations, and brain damage. Postponing shots increases the time a child is defenseless. Recent outbreaks of measles and Hib tell us that postponing shots puts healthy kids at risk for diseases none of us thought would come back.

EXPLAIN: A baby’s immune system can handle multiple shots with weakened or killed virus much better than it can fight off a serious disease. Postponing shots means your child could get sick and risk serious complications. It’s obvious you want to protect your child, but alternative schedules take advantage of parents’ worries; they’re not based on science.

ASK: Which vaccines are causing you worry?
I DON'T BELIEVE IN MONSTERS...

BUT MY PARENTS DON'T BELIEVE IN VACCINATING...

I DON'T BELIEVE IN GHOSTS OR THE BOGEYMAN...

THAT'S WHAT KEEPS ME UP AT NIGHT!
