PREFACE

Purpose of This Report

The Alaska Vital Statistics Annual Report summarizes information on births, deaths, adoptions, marriages, and separations. The purpose of this report is to provide a general reference for public health statistics and vital events in the state of Alaska.

Prepared By

Reports are prepared by the Health Analytics Unit of the Alaska Health Analytics and Vital Records Section.

Clint J. Farr, M.S., Chief
Rosa Avila, Ph.D., Public Health Scientist
Rebecca Topol, S.M., Research Analyst IV
Richard Raines, M.S., Research Analyst III

The Alaska Vital Statistics Annual Report is available online at:

dhss.alaska.gov/dph/vitalstats/pages/data/

Additional Information

We welcome any comments, questions, or concerns you may have about this report. The Health Analytics Unit is also available for special information requests on vital statistics data. The fee for research is \$75/hour for requests over five hours. For further information, please contact the Health Analytics Unit at:

Alaska Department of Health and Social Services

Acknowledgments

Data and health indicators presented in this report are based on information supplied by many people throughout the state. Parents, doctors, birth attendants, medical facilities, medical examiners, magistrates, funeral directors, and many other individuals provide information on vital records.

The Health Analytics and Vital Records Section staff extends our gratitude to each person who participates in our data collection effort. Accurate data are essential to the Section's effort to report reliable vital event information, and contribute to public health efforts in Alaska. We appreciate the assistance of others in maintaining the integrity of our data.

4. Deaths per 100,000 Alaska population, age-adjusted by year 2000 U.S. standard population (see Appendix B).

5. Infant deaths per 1,000 live births. Calculated using death cohort method (see Appendix A).

6. Births per 1,000 Alaska population.

7. Births per 1,000 Alaska female population, aged 15-44 years old.

8. Births per 1,000 Alaska female population, aged 15-19 years old.

9. Events per 1,000 Alaska population.

INTRODUCTION

About Alaska

Alaska is the largest of the 50 states and contains approximately 16 percent of the country's landmass. Because of its size, Alaska has widely diverse geographic, climatic, and demographic characteristics, all of which affect public health.

Alaska contains roughly 586,412 square miles of land. It also contains more miles of coastline than all of the contiguous lower 48 states combined (approximately 6,640 miles, not including islands), as well as over 5,000 glaciers, 3 million fresh water lakes, and 3,000 rivers (of which the Yukon ranks among the longest in the United States). Much of the coastline and fresh water areas are used as transportation corridors, or fishing grounds. Remote lands are used for hunting and recreational activities.

Unique climatic conditions affect Alaska's people. Temperatures can range from highs up to 100°F, to lows approaching minus 80°F. Alaska experiences extremes in precipitation as well, receiving up to 200 inches of precipitation annually in some areas, while others receive as little as 12 inches.

With diverse cultures, sparse populations, severe temperatures, vast coastlines, and outdoor lifestyles, the state experiences many unique health care challenges. One such challenge is assisting residents who live in remote areas of the state. A combination of organizations, such as Alaska Native Regional Corporations, the State of Alaska, and private health care entities, provide health care, public health facilities, funding, and personnel in many areas.

The Alaska Vital Statistics Annual Report, prepared by the Health Analytics and Vital Records Section (HAVRS), is designed to provide information on a variety of vital events for health care planners, providers, research professionals, students, policy

makers, the general public, and others with an interest in Alaska public health issues.

Occasionally, comparisons will be made between Alaska and national public health trends. Differences in trends between Alaska and the rest of the United States may reflect characteristics or challenges that are unique to the state. By reporting these indicators, our hope is to assist others in evaluating the status of public health in Alaska.

How Vital Statistics are Collected

The Alaska Vital Statistics Act (Alaska Statute (AS) 18.50) requires the Department of Health and Social Services to install, maintain, and operate a system of vital records. This system contains information on Alaska births, deaths, divorces, marriages, and adoptions, among other events.

When a birth occurs in Alaska, there is a legal process for recording that birth (AS 18.50.160). Typically, a physician, midwife, or hospital medical records staff member enters the birth record information into the Electronic Vital Records System (EVRS) database using information provided by the birth parent(s) and the delivery attendant.

Similarly, death records are entered in EVRS by funeral home staff members, and then certified by the attending physician or medical examiner. Death certificates should be filed within three days of the date of death (AS 18.50.230). After vital records have been entered into the system, they are then reviewed and registered by the HAVRS Registration Unit in Juneau.

Alaska also participates in the State and Territorial Exchange of Vital Events (STEVE) system. STEVE is a cooperative arrangement that facilitates the exchange of vital records data between states, as well as certain U.S. territories and jurisdictions. This ensures that vital events, such as the death

of an Alaska resident that occurred out of state, is received and recorded in EVRS. Conversely, non-residents vital events occurring in Alaska are also forwarded to their respective state's registrar. Unless otherwise noted, the Annual Report presents birth and death information on Alaska residents, regardless of where the death occurred. Counts of marriages and separations are based on events that occur in Alaska, regardless of residency status. Counts of adoptions are based on children who were born in Alaska.

Under HAVRS oversight, the Alaska Court System issues marriage licenses and files a certificate for each marriage performed in the state. The certificate should be filed with the local recording office of the Court System within seven days of the marriage (AS 18.50.270). The local recording office then forwards the certificate to HAVRS for registration and permanent retention. Since 1997, HAVRS has been issuing marriage licenses in Juneau, and Anchorage, as well as registering and providing permanent retention of documents. Marriage licenses in other parts of the state continue to be issued by the Court System under the Section's oversight. Alaska began issuing marriage licenses to same-sex couples on October 13th, 2014.

Divorce, dissolution, and annulment certificates are prepared by a clerk of the court from information provided by the petitioner, plaintiff, and/or court documents. The completed certificate is then forwarded to HAVRS for final registration (AS 18.50.280).

For each adoption granted in Alaska, a report of adoption is prepared and registered with HAVRS (AS 18.50.210). These include both Alaska State Court approved adoptions and Tribal Court approved adoptions, as well as Cultural Adoptions (Village Council approved adoptions of Alaska Native children).

How Certificates are Processed

In 2013, HAVRS implemented a new system for registering and storing information on vital events known as the Electronic Vital Records System (EVRS). This replaces the previous database system (Lightspeed), and enables hospital and clinical staff, birth attendants, physicians, medical examiners, funeral home directors, and other qualified birth/death certifiers to enter vital statistics information into the system.

As record information is entered, the system conducts data integrity checks. Missing or out-of-range information is returned to the facility or birth attendant for verification and/or correction. When the event information has been finalized and entered into EVRS, records are certified and permanently archived by HAVRS.

For death records, a physician or medical examiner works to determine the cause(s) of death, and narrative descriptions are entered on the death certificate. These narrative, or "text literal", causes of death are forwarded to the National Center for Health Statistics (NCHS), who code causes of death according to International Classification of Diseases Version 10 (ICD-10) standards. Final ICD-10 codes for the underlying and/or contributing cause of death are then returned to HAVRS, and uploaded back into the corresponding EVRS record. Unless otherwise noted, causes of death in the Annual Report are based on the underlying cause of death ICD-10 code.

Once all vital events from a calendar year have been entered into EVRS, and records have been checked for accuracy and completeness, the Section's Health Analytics Unit conducts the statistical analyses from which the tables, charts, and information in the Annual Report is based.

There are a number of ways to report on vital events, including the numbers of observations, rates based on total populations, or rates based on specific populations. For a discussion of the use

of vital statistics, and a comparison of different populations, see Appendix B.

Population Estimates

Population estimates used in this report were obtained from the Alaska Department of Labor and Workforce Development, Division of Administrative Services, Research and Analysis Section, Demographics Unit. Population estimates are updated annually. Total population estimates are revised each year to correspond to the United States Census Bureau's estimated state total. Using the decennial census as a base, birth, death, Internal Revenue Service, Alaska Permanent Fund and education statistics are used to produce annual population estimates for geographic areas (see Appendix D).

The age of a population is important when interpreting vital statistics, because behaviors and health risks of younger populations differ from those exhibited by older populations. Sex, race, and age distributions within a population are also important. In 2017, the most recent year for which data are available, the median age of Alaska residents was 34.6 years old for males, 35.2 years old for females, and 34.9 years old overall. The median age for the United States was 36.9 years old for males, 39.6 years old for females, and 38.2 years old overall.¹

Determination of Race and Ethnicity

The NCHS issues guidelines for determining the race of a child at birth. With few exceptions, the child's race on the birth certificate is the same as the mother's stated race. These guidelines became effective in 2003.

Sometimes race may be recorded differently on an individual's death certificate. This can influence death rates, particularly in the case of infant mortality, where, for example, a child's race may be reported as white on the birth certificate

because the mother is white, but Alaska Native on the death certificate because the father is Alaska Native. Unless otherwise noted, the race of the deceased is based on the race provided on the death certificate.

This report classifies race using NCHS provided bridged race categories. Bridging "refers to making data collected using one set of race categories consistent with data collected using a different set of race categories, to permit estimation and comparison of race-specific statistics at a point in time or over time".² Bridged race categories allows multiple-race respondents to be classified using a single category for statistical purposes, and allows comparison of records over periods when collection of race information has been revised. Four race categories are reported: Caucasian (White), American Indian or Alaska Native (AI/AN), Asian, Native Hawaiian or Other Pacific Islander (Asian/PI), and Black or African American (Black).

One ethnicity category for Hispanic (of any race) is also reported, and includes peoples of Cuban, Mexican, Puerto Rican, South or Central American, or Other Hispanic origin. The reported race categories are not exclusive to non-Hispanic ethnicity; therefore, persons with Hispanic ethnicity are included in applicable race categories.

2018 Facts

- Alaska resident mothers gave birth to 10,092 babies.
- August had the largest number of births by month (934).
- The most popular girl's name was Olivia.
- The most popular boy's name was Oliver.
- The mean age of mothers was 28.6 years old,
- The mean age of fathers was 31.3 years.
- Teenage mothers (aged 15-19) gave birth to 422 babies.
- The youngest mother was 14 years old, while the oldest was 49.
- The youngest father was 15 years old, while the oldest was 71.

Birth Summary

In 2018, Alaska mothers delivered 10,092 live births. Olivia was the most popular name for newborn girls, while Oliver was the most popular name for newborn boys (Table 1).

In 2018, the **crude birth rate**, which measures the number of births per 1,000 Alaskan residents, was 13.7 (Table 2). Because the overall population includes both men and women, and women over prime childbearing age, fertility rates are a more meaningful measure for analyzing birth trends.

Fertility rates measure the number of births per 1,000 Alaska resident women between the ages of 15 and 44 years old only. In 2018, Alaska's overall fertility rate was 69.3 births per 1,000 population. American Indian/Alaska Native women had the highest fertility rate by race, at 84.0 births per 1,000 population (Figure 1). Women aged 25 to 29 had the highest fertility rate by age group, at 116.3 births per 1,000 population. Southwest Alaska had the highest fertility rate by Public Health Region, at 101.1 births per 1,000 population (Table 2).

Teen Births

In 2018, there were 422 births to teenage mothers aged 15-19 years old. The **teen birth rate**, which measures the number of births per 1,000 Alaska resident women aged 15-19 (which can also be defined as the age-specific fertility rate for women aged 15-19) was 18.8 births per 1,000 population. American Indian/Alaska Native women had the highest teen birth rate by race, at 35.7 births per 1,000 population. Northern Alaska had the highest teen birth rate by Public Health Region, at 56.4 births per 1,000 population (Table 3).

Medical Services Utilization

In 2018, 77.9 percent of mothers received **prenatal care (PNC)** in their first trimester of pregnancy.¹

1. Medical utilization, infant health characteristic, and risk factor percentage calculations do not exclude records with unknown/missing responses from the total number of births.

PNC in the 1st trimester was lowest among Asian/Pacific Islander mothers, at 69.5 percent (Table 4).

The overall adequacy of PNC mothers receive is estimated using the **Adequacy of Prenatal Care Utilization** index, which evaluates the initial date that PNC began, and the number of PNC visits (see Appendix C). The percentage of mothers that received PNC rated as adequate or better was 62.6 percent. Adequate PNC was lowest among Asian/Pacific Islander mothers, at 52.0 percent (Table 4).

Births delivered by **cesarean section** made up 22.4 percent of all births. Cesarean sections were highest among Black/African American mothers, at 27.3 percent (Table 4).

Infant Health Characteristics and Risk Factors

Low birthweight is defined as live births in which the infant weighs less than 2,500 grams (approximately 5.5 pounds) on delivery. In 2018, 5.9 percent of births were low weight. Low weight births were highest among Black/African American mothers, at 10.4 percent (Table 5).

Preterm births, which are defined as births prior to the 37th week of gestation, made up 10.7 percent of all births. Preterm births were highest among Black/African American mothers, at 15.0 percent (Table 5).

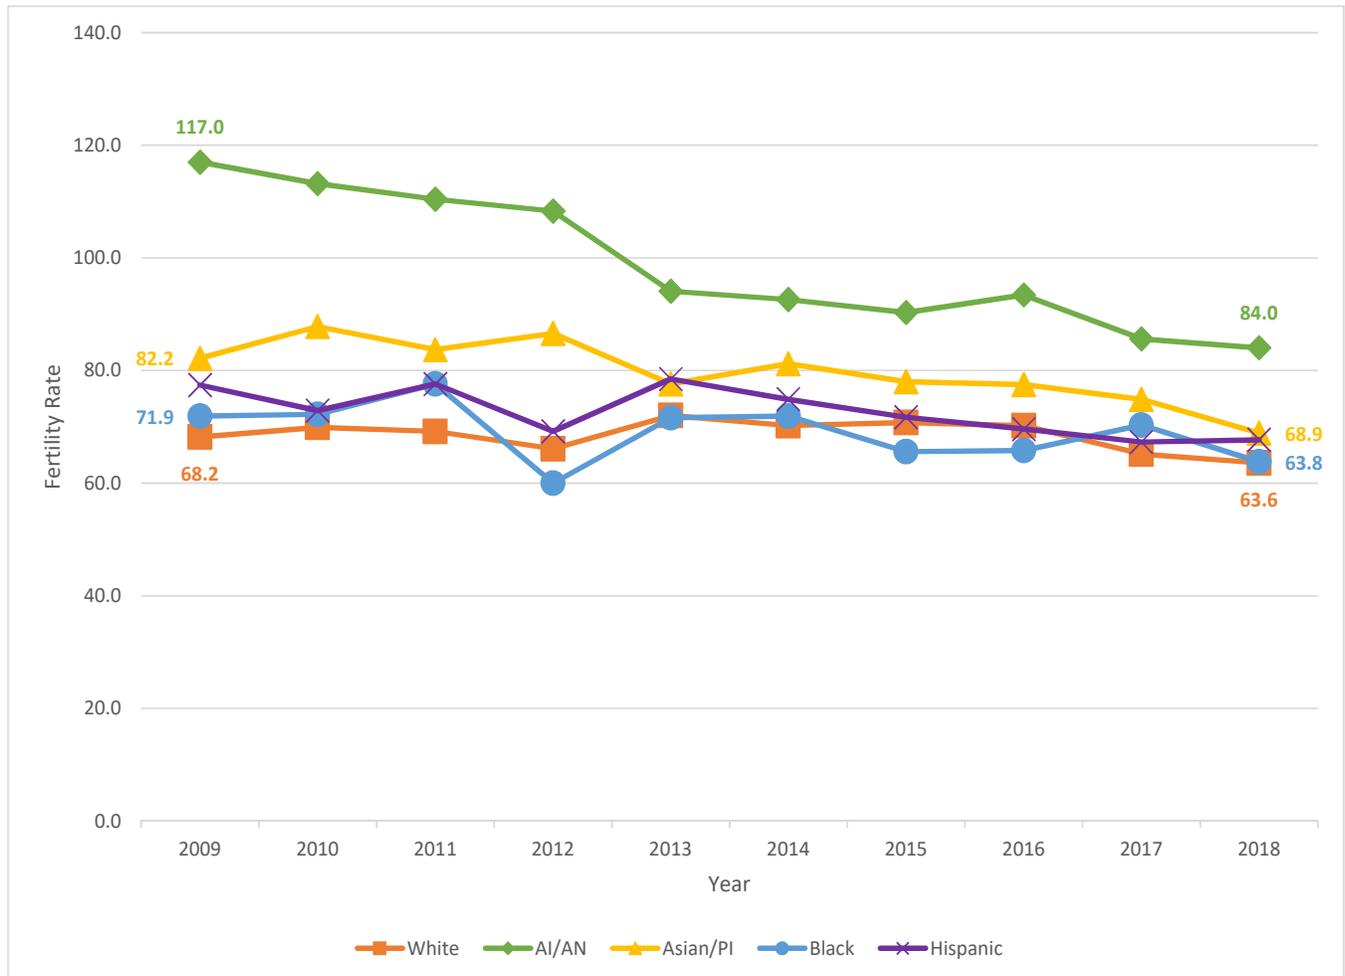

In 2018, 14.1 percent of mothers reported **tobacco use** during pregnancy or 3 months prior, which is a risk factor for low birthweight and preterm births. Tobacco use was highest among American Indian/Alaska Native mothers, at 30.7 percent (Table 5).

Table 1: Top Baby Names by Sex (2014-2018)

Rank	Girl					Boy

2016-2018 Facts

- There were 200 fetal deaths.
- There were 179 infant deaths (101 neonatal and 78 postneonatal).
- Congenital malformations, deformations, and chromosomal abnormalities were the leading cause of neonatal death.
- Sudden infant death syndrome was the leading cause of postneonatal death.
- There were 233 deaths of children aged 0-4 years.
- There were 77 deaths of children aged 5-14 years.
- There were 125 deaths of teens aged 15-19 years.

Note: Due to the relatively low number of fetal, infant and child deaths in a single year, three year moving sums and averages are used throughout this chapter (see Appendix B).

Fetal Death

Fetal deaths are defined as deaths prior to the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy, excluding induced termination.¹ Between 2016-2018, there were 200 fetal deaths (Table 6).

The **fetal death rate** measures the number of fetal deaths per 1,000 live births and fetal deaths combined. Between 2016-2018, the fetal death rate averaged 6.3 deaths per 1,000 live births and fetal deaths. Fetal death rates were highest in the Southwest region, at 11.6 fetal deaths per 1,000 live births and fetal deaths (Table 6).

Infant Death

Infant deaths are defined as deaths occurring between 0 and 364 days of live birth. Infant deaths can be further divided into **neonatal deaths**, which occur in the first 27 days after birth, and **postneonatal deaths**, which occur between 28-364 days after birth. Neonatal death is frequently associated with circumstances related to pregnancy or delivery, while postneonatal death is often related to living conditions or the home environment.

Between 2016-2018, there were 179 infant deaths, including 101 neonatal and 78 postneonatal deaths (Table 7). The **infant death rate** measures the number of infant deaths per 1,000 live births in a given year². Between 2016-2018, the infant death rate averaged 5.6 deaths per 1,000 live births (Table 8). American Indian/Alaska Native residents had the highest average infant death rate by race, at 10.1 deaths per 1,000 births.

Between 2016-2018, congenital malformations, deformations, and chromosomal abnormalities

1. Alaska Statute 18.50.240 requires the filing of a fetal death certificate for each death where gestation lasts at least 20 weeks. Fetal death records with fewer than 20 weeks gestation, or where gestation age is unknown, are not included. See Appendix A for additional data notes.

2. Infant death rates are calculated using the death cohort method (see Appendix A).

were the leading cause of all infant deaths (37 deaths) (Table 9). This was also the leading cause of death during the neonatal period (29 deaths) (Table 11). Sudden Infant Death Syndrome was the leading cause of death during the postneonatal period (20 deaths) (Table 11).

Child Death

Between 2016-2018, there were 233 deaths of children under five years old. There were also 77 deaths of children aged 5-14 years old, and 125 deaths of teenagers aged 15-19 years old.

Death rates for children and teens up to 19 years old are calculated as **age-specific death rates**, and represent the number of deaths per 100,000 Alaskan residents in the same age group. The **under five death rate** is also calculated, which represents the number of deaths of children aged 0-4 years old per 1,000 live births in a given year, similar to the infant death rate.

Between 2016-2018, the age specific death rates for children aged 0-4 years old and children aged 5-14 years old averaged 148.8 and 24.2 deaths per 100,000 population, respectively. Alternatively, the under five death rate for children aged 0-4 years old in terms of live births, averaged 7.3 deaths per 1,000 live births (Tables 12-13). The age-specific death rate for teens aged 15-19 years old averaged 87.1 deaths per 100,000 population (Table 14).

Copyright Rie Munoz, Ltd.

2018 Facts

- There were 4,461 deaths.
- Malignant neoplasms (cancers) were the leading cause of death.
- November had the largest number of deaths by month (404).
- The oldest male decedent was 102 years old.
- The oldest female decedent was 105 years old.
- The mean and median age of death for males was 64.2 and 67.0 years, respectively.
- The mean and median age of death for females was 69.3 and 73.0 years, respectively.

Death Summary

There were 4,461 Alaska resident deaths during 2018. The overall **crude death rate**, which measures the number of deaths per 100,000 Alaska residents, was 605.9. Because populations with higher proportions of older residents will naturally have higher crude death rates, **age-adjusted death rates** are generally a more meaningful measure for analyzing mortality trends between different groups (see Appendix B).

In 2018, Alaska's overall age-adjusted death rate was 707.5 deaths per 100,000 population. The age-adjusted death rates for men and women were 820.4 and 600.5 deaths per 100,000 population, respectively. American Indian/Alaska Native residents had the highest age-adjusted death rate by race, at 1,168.3 deaths per 100,000 population. Northern Alaska had the highest age-adjusted death rate by Public Health Region, at 1,088.2 deaths per 100,000 population (Table 15).

Years of Potential Life Lost (YPLL)

Years of Potential Life Lost (YPLL) measures the impact of premature mortality, and is defined as the difference between an expected natural lifespan of 75 years, and the actual age of death before that time (see Appendix B). In 2018 there were 55,041 YPLL among Alaska residents overall (Table 16).

Alaska's **age-adjusted YPLL rate**, which is defined as YPLL per 100,000 Alaska residents under the age of 75 years old (adjusted by year 2000 U.S. standard population) was 7,581 YPLL per 100,000 population. Age-adjusted YPLL rates for men and women were 9,215 and 5,826 years per 100,000 population, respectively. American Indian/Alaska Native residents had the highest age-adjusted YPLL rates by race, at 15,442 YPLL per 100,000 population (Table 16).

Leading Causes of Death (LCOD)

In 2018, ten leading causes of death (LCOD) were responsible for 3,231 deaths, or 72.4 percent of all deaths (Table 17). Tables 18 through 29 provide additional information on each of 2018's ten leading causes of death. The top three causes are discussed below:

Malignant neoplasms, also known as cancers, were the leading cause of death in 2018, and were responsible for 957 deaths. Malignant neoplasms made up 21.5 percent of all deaths, and had an age-adjusted death rate of 141.6 deaths per 100,000 population. American Indian/Alaska Native residents had the highest age-adjusted death rate by race, at 188.8 deaths per 100,000 population (Table 18). Malignant neoplasms were responsible for the deaths of approximately 121 men for every 100 women (Figure 4). The lungs and bronchus were the leading sites of malignant neoplasms, and were responsible for 213 deaths, or 22.3 percent of all malignant neoplasm deaths (Table 19).

Diseases of the heart were the second leading cause of death in 2018, and were responsible for 814 deaths. Diseases of the heart made up 18.2 percent of all deaths, and had an age-adjusted death rate of 130.4 deaths per 100,000 population. American Indian/Alaska Native residents had the highest age-adjusted death rate by race, at 207.1 deaths per 100,000. Diseases of the heart were responsible for the deaths of approximately 181 men for every 100 women (Figure 4).

Unintentional injuries were the third leading cause of death in 2018, and were responsible for 397 deaths. Unintentional injuries made up 8.9% of all deaths, and had an age-adjusted death rate of 56.3 deaths per 100,000 population. American Indian/Alaska Native residents had the highest age-adjusted death rate by race, at 137.6 deaths per 100,000 (Table 21). Unintentional injuries were responsible for the deaths of approximately 194 men for every 100 women (Figure 4). Unintentional injuries were also the number one leading cause of YPLL, and were responsible for 11,142 YPLL, and an

age-adjusted YPLL rate of 1,636 YPLL per 100,000 population (Table 17). Poisoning or exposure to noxious substances were the leading cause of unintentional injury, and were responsible for 142 deaths, or 35.8 percent of all unintentional injury deaths. This was followed by motor vehicle accidents, which were responsible for 95 deaths, or 23.9 percent of all unintentional injury deaths (Table 22).

Select Causes of Death (SCOD)

Tables 30 through 33 provide additional information on three select cause of death (SCOD) categories that reflect subjects of special public health interest: alcohol-induced, firearm-related, and drug-induced. Because these categories may overlap with deaths also included in the leading cause of death categories (e.g. firearm-related includes deaths from both the unintentional injuries and intentional self-harm categories), these causes are discussed separately.

Alcohol-induced mortality includes deaths due to alcohol psychoses, alcohol dependence syndrome, non-dependent abuse of alcohol, alcohol-induced chronic liver disease and cirrhosis, and alcohol poisoning. It does not include deaths due to traumatic injury such as motor vehicle accidents. In 2018, there were 203 alcohol-induced deaths, and an age-adjusted death rate of 26.3 deaths per 100,000 population. American Indian/Alaska Native residents had the highest statistically reliable age-adjusted death rate by race, at 110.3 deaths per 100,000 population (Table 30).

Firearm-related mortality includes deaths due to the discharge of a firearm, either by unintentional discharge, assault (homicide), intentional self-harm (suicide), legal intervention, or undetermined intent. In 2018, there were 155 firearm-related deaths, and an age-adjusted death rate of 21.3 deaths per 100,000 population. American Indian/Alaska Native residents had the highest statistically reliable age-adjusted death rate by race, at 28.7 deaths per 100,000 population (Table 31).

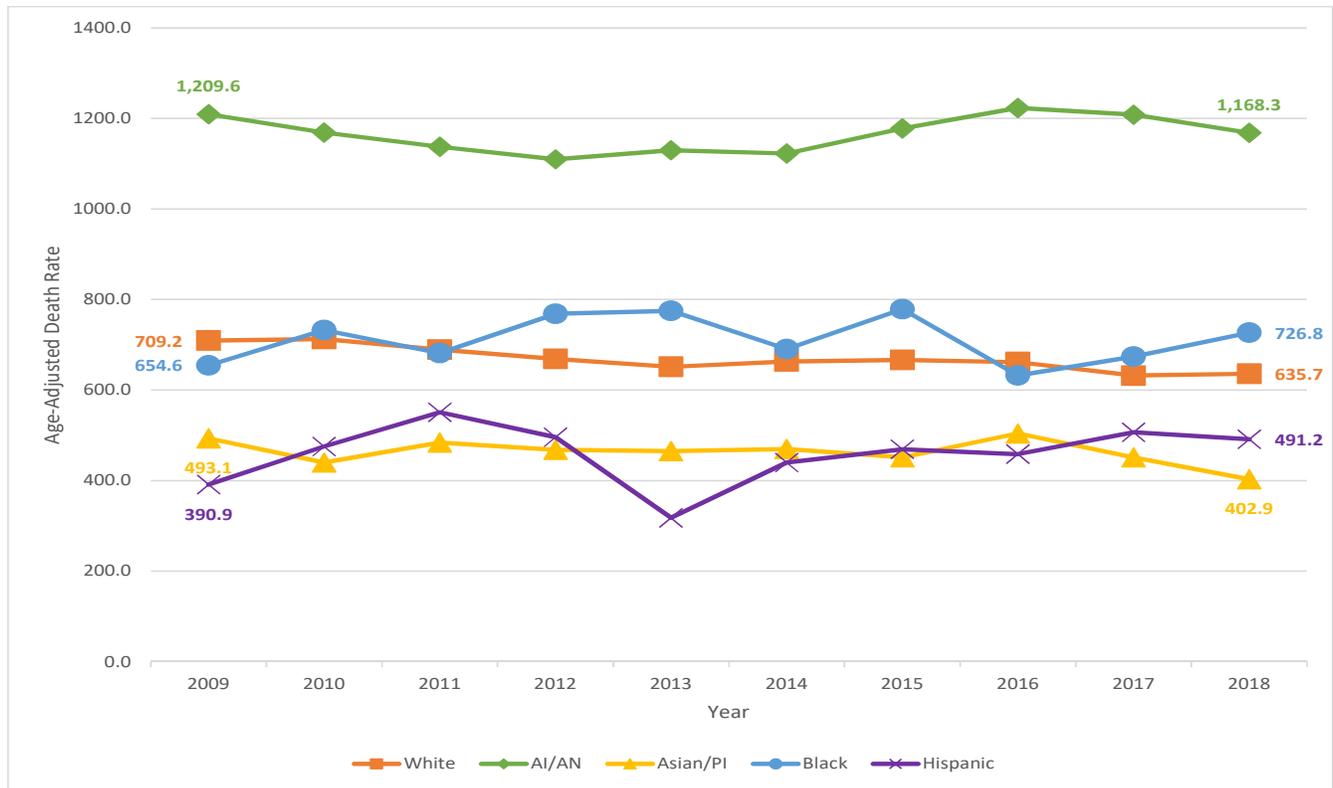

Firearm discharges were responsible for 107 suicide deaths, or 58.2 percent of all suicides. Firearm discharges were also responsible for 37 homicide deaths, or 66.1 percent of all homicides deaths (Table 22).

Drug-induced mortality includes deaths due to drug overdose, medical conditions from the chronic use of drugs, or the unintentional misuse of drugs or drug combinations. These can be due to dependent and non-dependent use of illicit, prescription, or over-the-counter drugs. It does not include injuries, or other causes indirectly related to drug use. In 2018, there were 119 drug-induced deaths, and an age-adjusted death rate of 15.8 deaths per 100,000 population. American Indian/Alaska Native residents had the highest statistically reliable age-adjusted death rate by race, at 22.0 deaths per 100,000 population (Table 32).

Overdoses were responsible 110 deaths, or 92.4 percent of all drug-induced deaths. Table 33 provides additional information on the types of drugs contributing to overdose mortality. Because multiple drug types can be involved in a single death, overdose categories are not mutually exclusive, and deaths can be counted under multiple categories (e.g. an overdose involving both heroin and cocaine will be included in both categories).

Opioids, psychostimulants, and benzodiazepines were some of the most common drug types involved in overdose deaths. Opioids were involved in 66 overdose deaths, or 60.0 percent of all overdoses. Psychostimulants were involved in 50 overdose deaths, or 45.5 percent of all overdoses. Benzodiazepines were involved in 24 overdose deaths, or 21.8 percent of all overdoses (Table 33).

Figure 3: All Causes Age-Adjusted Death Rates by Race and Ethnicity (2009-2018)

Note: Age-adjusted death rates represent deaths per 100,000 population, adjusted by year 2000 U.S. standard population ratios.

Note: Age-adjusted death rates represent deaths per 100,000 population, adjusted by year 2000 U.S. standard population ratios. Not all cancer sites shown. Cancers that predominantly affect one sex (e.g. Breast, Prostate, etc.) are shown on a sex-specific basis.

* Rates based on fewer than 20 events are statistically unreliable and should be used with caution.

** Rates based on fewer than 6 events are not reported.

- Psychostimulants (T436)	29	27	49	64	50	3.9	3.6	6.3	8.9	6.9
- Methamphetamine (T436 w/ methamphetamine cited)	27	25	47	59	45	3.6	3.3	6.1	8.2	6.1

Note: Age-adjusted death rates represent deaths per 100,000 population, adjusted by year 2000 U.S. standard population ratios. Drug overdose contributing cause subcategories are not mutually exclusive, and deaths can be included in multiple categories (e.g. Cocaine and Heroin). Fentanyl and Methamphetamine estimates are based on contributing cause ICD-10 codes and drug-specific keywords cited on the death certificate's descriptive text literal fields.

* Rates based on fewer than 20 events are statistically unreliable and should be used with caution.

** Rates based on fewer than 6 events are not reported.

2018 Facts

- There were 4,940 marriages, and 2,759 separations.
- July had the largest number of marriages by month (721).
- January had the smallest number of marriages by month (236).
- August had the largest number of separations by month (271).
- February had the smallest number of separations by month (199).

Marriages Summary

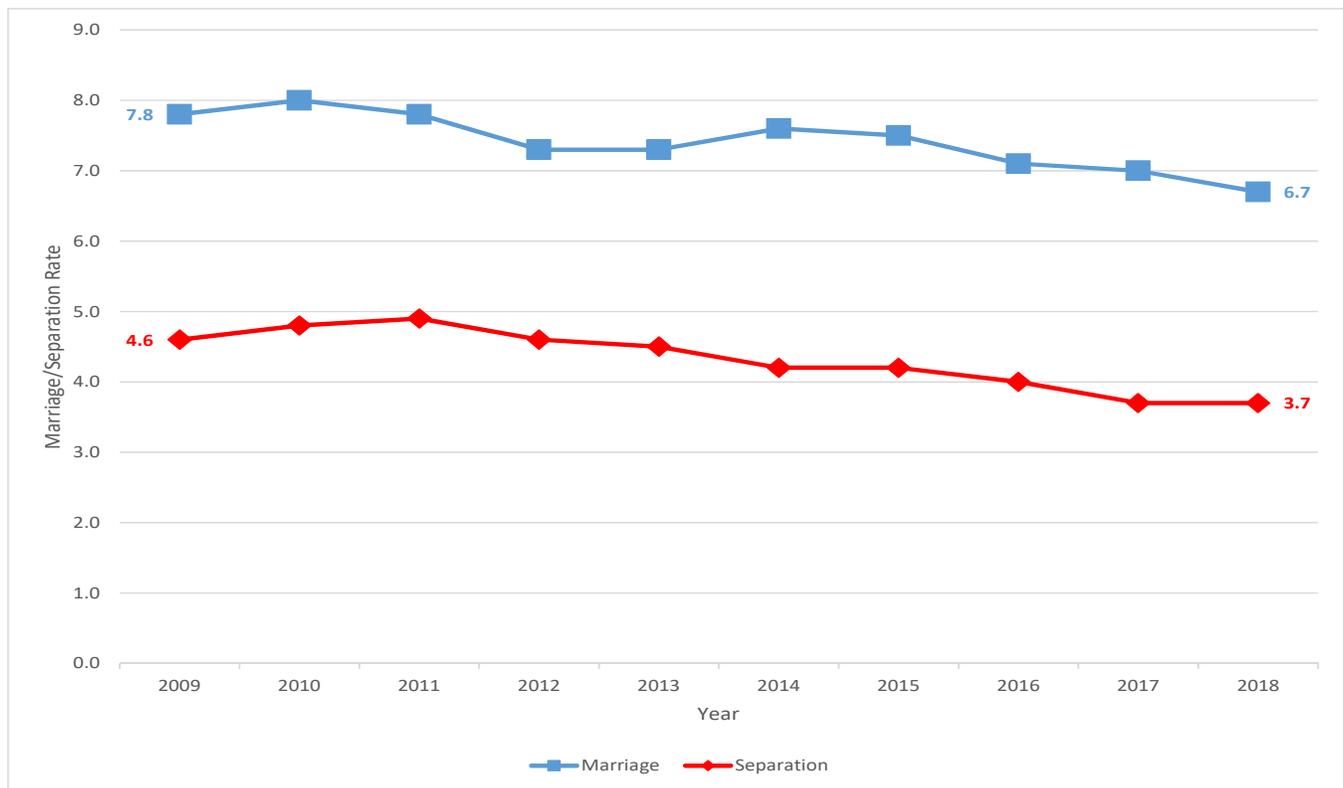

In 2018, there were 4,940 marriages in Alaska. The **marriage rate**, which measure the number of marriages (regardless of residency status) per 1,000 Alaskan residents, was 6.7. Approximately 78 marriages, or 1.6 percent of all marriages, were between same-sex couples.¹ Marriages between Alaska resident couples made up 82.9 percent of all marriages, while marriages between non-residents couples made up 11.0 percent of all marriages. (Table 34). Between 2014-2018, most marriages were between two partners aged 20-24 years old, making up 14.1 percent of all marriages (Table 35).

Separations Summary

In 2018, there were 2,759 separations in Alaska. The **separation rate**, which measure the number of separations (regardless of residency status) per 1,000 Alaskan residents, was 3.7. Approximately 37 separations, or 1.3 percent of all separations, were between same-sex couples.¹ There are three administrative procedures for terminating a marriage in Alaska: dissolution, divorce, and annulment. Divorces made up 57.0 percent of all separations, while dissolutions made up 42.8 percent. Between 2014-2018, most separations were between two partners aged 25-29 years old, making up 8.6 percent of all separations (Table 35).

1. Partner sex is not recorded on marriage or divorce certificates, but is indirectly estimated through use of gendered terms that are recorded (groom/husband = male, bride/wife = female, spouse = not specified). Alaska began registering same sex marriages on October 13th, 2014.

Figure 5: Marriage and Separation Rates (2009-2018)

Note: Marriage and separation rates represent events per 100,000 population.

Table 34: Marriages and Rates by Sexual Orientation, Alaska Residency Status, and Public Health Region (2014-2018)

	Marriages					Marriage Rate				
	2014	2015	2016	2017	2018	2014	2015	2016	2017	2018

2018 Facts

- There were 735 adoptions granted.
- Alaska state courts granted 553 adoptions.
- Alaska Native Village Councils and Tribal Courts granted 182 adoptions.
- The mean and median age of adoption was 6.1 and 6.0 years old, respectively.

Adoptions Summary

There were 735 adoptions of Alaska children granted in 2018.¹ The Alaska state court system granted 75.2 percent of adoptions (553 adoptions), while the remainder were granted by Alaska Native Tribal courts (37 adoptions), or through cultural adoptions approved by Alaska Native Village Councils (145 adoptions) (Table 38).

Adoption rates measure the number of adoptions granted per 1,000 Alaskan residents. American Indian/Alaska Native children had the highest adoption rate by race at 2.8 adoptions per 1,000 population. Adoption rates by child's sex were equal, at 1.0 adoptions per 1,000 population (Table 38).

1. Adoptions of children without an Alaska birth certificate (including adoptions of foreign nationals), and adoptions of Alaska-born children to out of state adoptive parents are not included. Adoptions statistics are not comparable to reports prior to 2015.

Table 38: Adoptions and Rates by Sex of Child, Race and Ethnicity of Child, and Adoption Type (2014-2018)

	Adoptions					Adoption Rate

Alaska	757	650	740	755	735	1.0	0.9	1.0	1.0	1.0

Note: Adoption rates represent adoptions per 100,000 population. Rates by adoption type are not applicable.

* Rates based on fewer than 20 events are statistically unreliable and should be used with caution.

** Rates based on fewer than 6 events are not reported.

APPENDIX A: TERMS

Adoption Rate: The number of adoptions divided by the estimated population, multiplied by a constant of proportionality (usually 1,000). This report does not include adoptions of children without an Alaska birth certificate, adoptions of foreign nationals, or adoptions of Alaska-born children to out of state adoptive parents.

Age-Adjusted Death Rate: A weighted average of age-specific death rates adjusted using one standard age distribution (usually the U.S. year 2000 standard population). This summary allows comparisons to be made between populations with different age distributions (see Appendix B for specific instructions on calculating age-adjusted rates).

Age-Specific Rate: The number of events for a specific age group divided by the population for the same age group, multiplied by a constant of proportionality (usually 1,000 or 100,000).

Birth Rate: The number of births divided by the estimated population, multiplied by a constant of proportionality (usually 1,000).

Cause of Death: Unless otherwise noted, the cause of death reported is the underlying cause of death, and is based on information contained on the death certificate, defined by the World Health Organization's International Classification of Diseases - Tenth Revision (ICD-10) as the disease or injury which initiated the train of morbid events leading directly to death, or the circumstances of the injury or violence which produced the fatality.

Constant of Proportionality: A constant number (often 1,000 or 100,000) which is used for calculating a rate so that comparisons are possible and more understandable. (e.g. it is easier to compare 21.7 to 21.3 per 1,000 than it is to compare 0.0217 to 0.0213.)

Crude Rate: The number of events divided by the estimated population, multiplied by a constant of proportionality (usually 1,000 or 100,000).

Death Rate: The number of deaths divided by the estimated population, multiplied by a constant of proportionality (usually 100,000).

Infant Death: Deaths occurring between 0 and 364 days of birth. Infant deaths can be further divided into neonatal deaths, which occur in the first 27 days, and postneonatal deaths, which occur between 28-364 days after birth.

Infant Death Rate: The number of infant deaths divided by the number of live births, multiplied by a constant of proportionality (usually 1,000). The infant death rate in this report is calculated using the "death cohort" method. The death cohort method is determined by dividing the number of infant deaths by the number of live births in a given calendar year. For example, to calculate the death cohort infant death rate for the current year, divide the total number of infant deaths for that year by the total number of live births that occurred the same year, and multiply the result by a constant of proportionality. By using the death cohort infant death method, some infant deaths will be counted in the current year even if that infant was actually born the year before. Other deaths to infants born in the current year who died before their first birthday the following year will not be counted.

Fetal Death: Deaths occurring prior to the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy, excluding induced termination. Alaska Statute 18.50.240 requires the filing of a fetal death certificate for each death where gestation lasts at least 20 weeks.

Note: Annual Reports published prior to 2016 erroneously stated that fetal death records with a gestational age estimate less than 20 weeks were

excluded from results. However, some records under 20 weeks, or with unknown gestational ages, were still counted. As of the 2018 Annual Report, fetal death statistics now correctly exclude all fetal deaths under 20 weeks, or with unknown gestational age. Fetal death statistics are not comparable to reports prior to 2018.

Fetal Death Rate: The number of fetal deaths, divided by sum of the number of live births and fetal deaths, multiplied by a constant of proportionality (usually 1,000).

Fertility Rate: The total number of live births divided by the number of women in the estimated population between ages 15 and 44, multiplied by a constant of proportionality (usually 1,000).

Gestation: The period beginning with the first day of the last normal menstrual period and ending with the day of birth. Births occurring between 37 and 41 weeks gestational age are considered full-term.

ICD-10: International Classification of Diseases - Tenth Revision. The official classification system which codifies all diseases and injuries. ICD-10 was first introduced in 1999. All deaths between 1978 and 1998 were coded using ICD-9.

Live Birth: A birth where the baby exhibits signs of life after delivery. These signs include breathing, beating of the heart, pulsation of the umbilical cord and movement of voluntary muscles.

Location of Occurrence: The place or location where a vital event occurred.

Location of Residence: Most tables report Alaska resident information, and are based on the location of actual residence. The location of actual residence; i.e., census area, is not necessarily the same as a person's "legal residence". The location of residence during a tour of military duty or while attending college is considered actual residence.

Low Birthweight: An infant born weighing less than 2,500 grams (approximately 5.5 pounds).

Marriage Rate: The number of marriages divided by the estimated population, multiplied by a constant of proportionality (usually 1,000). This report includes all marriages granted in Alaska, regardless of partner residency.

Neonatal Infant Mortality Rate: The number of deaths to infants less than 28 days of age divided by the number of live births, multiplied by a constant of proportionality (usually 1,000).

Postneonatal Infant Mortality Rate: The number of deaths to infants from 28 days up to one year old divided by the number of live births, multiplied by a constant of proportionality (usually 1,000).

Preterm Birth: An infant born prior to the 37th week of gestation.

Race of Infant: The reported race of the mother provided on the infant's birth certificate is considered the race of the infant. Prior to 1989, races of both parents were taken into consideration when determining the race of the infant using a look-up table. Beginning in 1989, the National Center for Health Statistics (NCHS) recommended that all states adopt the same standard for determining the race of the infant at birth.

Separation Rate: The number of separations divided by the estimated population, multiplied by a constant of proportionality (usually 1,000). Separations include divorce, dissolutions, and annulments. This report includes all separations granted in Alaska regardless of partner residency.

Standard Population: Age-adjusted rates are calculated using U.S. year 2000 standard population weights (see Table A.1). This weighting convention is based on a longstanding coordinated agreement among federal and state agencies to use a uniform standard for age adjustment of data (Table 39).¹

1. Age Adjustment Using the 2000 Projected U.S. Population, National Center For Health Statistics, Healthy People Statistical Notes (20), 2001.

Table 39: U.S. Year 2000 Standard Population

Age	2000 U.S. Standard Population (Millions)	Weight
0–4 years	69,135	0.069135
5–14 years	145,565	0.145565
15–24 years	138,646	0.138646
25–34 years	135,573	0.135573
35–44 years	162,613	0.162613
45–54 years	134,834	0.134834
55–64 years	87,247	0.087247
65–74 years	66,037	0.066037
75–84 years	44,842	0.044842
>85 years	15,508	0.015508
TOTAL	1,000,000	1.0000000

Teen Birth Rate: The number of births to females ages 15–19 divided by the estimated population of females ages 15–19, multiplied by a constant of proportionality (usually 1,000).

Under Five Death Rate: The number of deaths to infants and children less than five years of age divided by the number of live births in a given year, multiplied by a constant of proportionality (usually 1,000).

Years of Potential Life Lost (YPLL): The difference between a constant, representing the assumed natural life span in years of an individual (typically 75), and the actual age of death. (See Appendix B for calculation of years of life lost).

APPENDIX B: TECHNICAL NOTES

How to Use Vital Statistics

Vital Events: Vital events are registered with the Health Analytics and Vital Records Section, and include live births, fetal deaths (after at least 20 weeks gestation), deaths, adoptions, marriages, and divorces. Information on each of these events is provided on standard forms.

Reliability of the Data: The reliability of vital records may vary depending on the data collection method. For instance, some information on birth and death certificates is collected and provided by health facilities or medical professionals (birth weight, complications of labor and delivery, cause of death, etc.), while other information is self-reported or reported by relatives (smoking during pregnancy, marital status of deceased, etc.). The Section makes every effort to complete, verify, and correct information which is missing, invalid, or inconsistent. Ultimately, the reliability of the data depends on everyone who is involved in data collection, storage and retrieval: Section staff, medical professionals, magistrates, funeral directors, marriage commissioners, judges, and each individual involved in, or witness to, a vital event.

Comparing Populations: Comparing the number of events in two separate locations may not be meaningful. We can guess that Anchorage will have more births than Juneau because Anchorage has a larger population. A more meaningful question is, what is the number of births compared to the size of the population? To make this comparison, we calculate a ratio by dividing the number of events by the population for which that event could have occurred. For instance, if there were 4,200 births in Anchorage and a population of 280,000 people, then the ratio of births to population would be $4,200/280,000$ or 0.015 births for every person living in Anchorage. If there were 500 births in Juneau and a population of 30,000 then the ratio of births to population in Juneau would be

$500/30,000$ or 0.016666 births for every person living in Juneau.

Since small decimal numbers are difficult to interpret, we change the ratio to a rate by multiplying it by a constant of proportionality. This constant of proportionality can be any number, as long as the same number is used in calculating comparable rates. To calculate birth rates, we usually use a constant of proportionality of 1,000. Using this method, the birth rate for Anchorage would be $0.015*1,000$ or 15.0 births per 1,000 population. The birth rate for Juneau would be $0.016666*1,000$ or 16.7 births per 1,000 population. This number is usually rounded to the nearest tenth. We can see that while there are fewer births in Juneau in this example, the rate per 1,000 population is greater.

The birth rates described in the prior paragraph are crude birth rates because they compare events to the total population. A more meaningful comparison would use only the female population of childbearing ages (15–44 years of age). Let's assume that the number of fertile women aged 15–44 in Anchorage is 60,000, and in Juneau is 7,300. The Anchorage fertility rate would be $(4,200/60,000)*1,000$ or 70.0 births for every 1,000 women of childbearing age. The Juneau fertility rate would be $(500/7,300)*1,000$ or 68.5 births for every 1,000 women of childbearing age. While Anchorage would have a lower crude birth rate than Juneau in this example, the Anchorage fertility rate would be higher than for Juneau. This is because the ratio of women of childbearing age to the total population in Anchorage ($60,000/280,000$ or 0.2143) is lower than in Juneau ($7,300/30,000$ or 0.2433).

Constant of Proportionality: In calculating crude birth rates and fertility rates, we use a constant of proportionality of 1,000. Vital statistics may be reported with different constants of proportionality. Readers may familiarize themselves with how rates are calculated so that validity is maintained when

comparing rates. Unless rates are calculated with the same constant of proportionality, comparisons will lead to incorrect conclusions. For instance, in this report we calculate death rates per 100,000 population. If the another publication reported deaths per 1,000 population, you would need to convert the rates in this report (by dividing by 100) or the death rates in the other report (by multiplying by 100) in order to make a valid comparison.

Small Populations or Few Events: Data based on small populations and few events require particular care in data analysis. In Alaska, variability is expected when looking at small groups within the population. Precautions are taken to avoid drawing false conclusions from random or unusual events. A method that is used in this report to provide greater reliability is moving averages. (For an explanation of moving averages, see “Vital Statistics Formulas” below.)

Vital Statistics Formulas

Age-Adjusted Rates: Age-adjusted rates are calculated so comparisons can be made between populations that have different age distributions. For example, a population with a high proportion of young people, generally will have a lower crude death rate than a population with a high percentage of elderly persons. Age-adjusted rates are more appropriate than crude rates when comparing health indicators for populations that have different age distributions. The age-adjusted rates in this report were calculated using the standard population based on the decennial U.S. Census of 2000 (see the Standard Population in Appendix A).

$$AA = \sum (m_a * (p_a / p))$$

AA is age-adjusted rate

\sum is sum

m_a is the age-specific death rate for age group

p_a is the standard population for age group

p is the total standard population

Moving Averages: Calculations of multiple year moving averages can be performed when single-year rates are not reliable due to a small number of observations, or large fluctuations in the number of events from year to year. Moving averages can help to smooth out rates which would vary widely from one year to another, or otherwise be below standard reporting thresholds.

For example, single-year infant death rates are seldom good indicators for the state of infant health within Alaska because rates can fluctuate dramatically from year to year. For example, 67 infants died during 2008, 76 infants died during 2009, and 43 infants died during 2010. The single-year infant death rates during 2008, 2009 and 2010 were 5.9, 6.7 and 3.7 deaths per 1,000 births, respectively. Taking a 3-year average gives an infant death rate of 5.4 deaths per 1,000, which provides a more meaningful measure of infant mortality trends over time.

Years of Potential Life Lost: Years of potential life lost (YPLL) is the difference between a constant, representing the expected natural lifespan of an individual, and the age of a decedent who dies before that constant. The constant used in the calculation is ultimately arbitrary, but 75 is a common standard given that this is close to the median natural lifespan expected in many developed countries. This is the constant value used in this report. YPLL is a useful way to estimate the impact of specific causes of death, and emphasizes mortality in younger populations. For each cause of death, YPLL is calculated as follows:

$$YPLL = \sum (75 - \text{age})$$

YPLL is years of potential life lost

\sum is sum

75 is the assumed natural lifespan

age is the age of the decedent at death.

Life Expectancy

Life expectancy represents the number of years that an infant born in a given year can expect to live if they experience the same age-specific death rates as all persons who died during their birth year. Three year rolling averages are used to smooth out year-to-year fluctuations in life expectancy, and provide a more stable basis for comparison.

Between 2016-2018, average life expectancy for all Alaskan residents was 80.1 years.¹ Life expectancy for men was 6.5 years lower than women over the same period. American Indian/Alaska Native residents had the lowest life expectancy, at 73.2 years on average.

1. Corrections to the formula for the 85+ age group (see Table 40, Column H) resulted in slightly higher life expectancies than calculated in Annual Reports published prior to 2017. Life expectancy estimates are not comparable to reports prior to 2017.

Table 40: Average Life Expectancy by Sex, Race and Ethnicity, and Age Group (2012-2018)

	Life Expectancy				
	2012-2014	2013-2015	2014-2016	2015-2017	2016-2018

Column A: Sum of deaths during period.

Column B: Sum of population during period.

Column C: Ratio (A/B).

Column D: Proportion dying in the age group.

- For less than 1 year: $(2 * C) / (2 + C)$.
- For 1–4 years: $(2 * 4 * C) / (2 + 4 * (1.25 * C))$.
- All others $(2 * 5 * C) / (2 + 5 * C)$.

Column E: Proportion living in age group (1-D).

Column F: Number living at beginning of age.

- For less than 1 year: 100,000.
- All others: $E * F$ (both from next younger age group).

Column G: Number dying in the age group F.

- (this age group)-F (next older age group).

Column H: Number living in the age group.

- For less than one year: $F - (.85 * G)$

- For 1–4 years: $4 * F - (2.5 * G)$

- For 85+: (F/C)

- All others: $(5 * F) - (2.5 * G)$.

Column I: Cumulative population Sum of H for this and all older age groups.

Column J: Years left at beginning of age (I/F).

APPENDIX C: PRENATAL CARE

Adequacy of Prenatal Care

The Adequacy of Prenatal Care Utilization (APNCU) index makes use of two types of prenatal care information obtained from birth certificate data: when prenatal care began (adequacy of initiation) and the number of prenatal visits from when prenatal care began until delivery (adequacy of received services).¹ The APNCU index classifies the adequacy of initiation under the assumption that prenatal care starting earlier is better during the following months of pregnancy: months 1-2, months 3-4, months 5-6, and months 7-9.

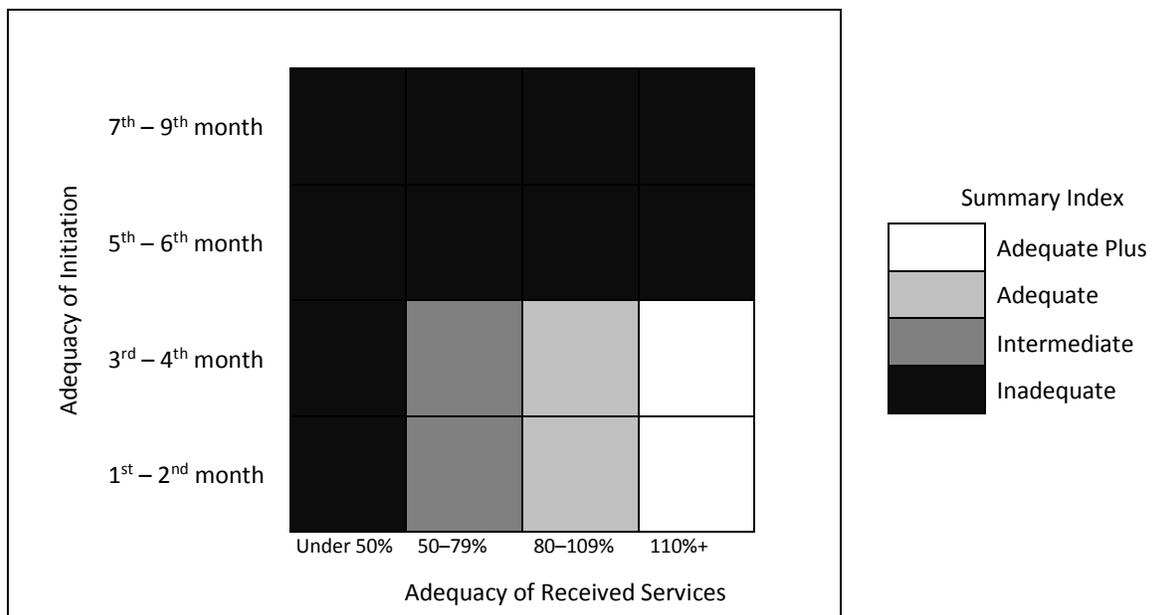

To classify the adequacy of received services, the number of prenatal visits is compared to the expected number of visits for the period between when care began and the delivery date. The expected number of visits is based on the American College of Obstetricians and Gynecologists prenatal

care standards for uncomplicated pregnancies and is adjusted for the gestational age when care began and for the gestational age at delivery. A ratio of observed to expected visits is calculated and grouped into four categories—Inadequate (received less than 50% of expected visits), Intermediate (50%–79%), Adequate (80%–109%), and Adequate Plus (110%). The final APNCU index measure combines these two dimensions into a single summary score (Figure 6).

While the APNCU index provides a reasonable starting point for evaluation of prenatal care, it also carries certain limitations. For example, the APNCU index does not measure the quality of a prenatal care visit, only the quantity of visits received. It is also dependent on how well the patient or provider recalls the date of initiation, and the number of visits. Furthermore, it may not be a good measure of adequacy of care for high-risk pregnancies due to the increased probability of services among at-risk patients.

APPENDIX D: POPULATION

Alaska Population

In 2018, Alaska's population was 736,239 persons, compared to 697,828 persons in 2009. Alaska's population by race was approximately 68.9 percent White (507,304 people), 17.4 percent American Indian/Alaska Native (127,929 people), 8.8 percent Asian/Pacific Islander (64,661 people), and 4.9 percent Black/African American (36,345 people) (Figure 7).¹

Alaska's population included 378,817 males, and 357,422 females. There were approximately 106 males for every 100 females (Table 42). This is compared to approximately 97 males for every 100 females in the U.S. (Figure 8).

The Anchorage, Matanuska-Susitna, Interior, and Gulf Coast Public Health Regions contained 80.6 percent of Alaska's population (593,380 people),

with 40.1 percent concentrated in Anchorage alone (295,365 people) (Table 43).

In 2018, children aged 0-14 years, made up 21.4 percent of Alaska's of Alaska's population (157,376 people). Teens, aged 15-19 years, made up 6.5 percent (47,566 people). Adults, aged 20-64 years, made up 60.3 percent (443,993 people). Seniors, aged 65 years and over made up 11.9 percent (87,304 people) (Table 44).

1. Bridged race estimates.
